SOFTWARE FOR GEOTAGGING MEDIA

June 14, 2016

INTRODUCTION

Media Geotagger – is a post-process software solution that will automatically geotag your digital media. This will enable you to sync the GPS track logs with photos, audio and video captured.

Advantages:

- Flexible and works with most digital cameras and GPS loggers
- Low cost alternative (no other hardware necessary)
- Light weight solution

FORMATS

Supported formats and platforms

- Video – MTS, M2TS, MOV, MP4, AVI, MOD, MPG, WMV
- Audio – MP3, 3GP, WMA, WAV
- Photos – JPEG, NEF
- GPS – GPX, NMEA
- OS – Windows XP, 7, and above

Best practice: ensure that the GPS track is longer than the video. This will make sure all of the media will be geotagged.

Note: Works with original media not copied. Creation time is different for original and copied media files.

Make sure the proper codecs are installed.

The k-lite codec pack can handle most video formats. Available for download here: <https://ninite.com/>
