

MediaGeotagger

THE SIMPLEST SOLUTION FOR GEOTAGGING PHOTOS AND VIDEOS

MediaGeotagger Features

- Syncs GPS data and photos/videos without a GPS enabled camera
- Gives you the exact location of where your images were taken
- Allows you to use your own equipment

MediaGeotagger is a software solution that allows you to sync GPS track logs with photos, video, and audio notes without having a GPS enabled camera. With MediaGeotagger, you are still able to find out the exact location of where a video or photo was taken. This software application eliminates the need for the purchase of new equipment; you can use the cameras that you already have alongside a GPS device.

How does it work?

MediaGeotagger takes the GPS track log from any GPS devices and syncs it with videos and photos that were captured while the device recorded the location track log. With the software, GPS information is synced to the media based on a time stamp and, then produces geo-tagged media that can be viewed with isWhere, GeoVideo, and MediaMapper Server.

Though there are many devices that encode still media with geo-location, MediaGeotagger is the only software available that can geo-tag video in post processing and is the lowest cost solution for geo-locating your videos.

With Red Hen Systems isWhere, GeoVideo, or MediaMapper Server, you can effectively view your geo-tagged media on a map.
